

## Sign Board

- Logos and clipart easily converted to signage.
- Sign Board is impact resistant and ideal for areas where vandalism is a concern. Material will not dent like metal. Paint will not chip like painted wood signs.
- Sign Board has a non-stick surface. It resists markings by pens, markers, and spray paint, and can easily be cleaned with regular household cleaners.
- Sign Board does not absorb water. Unlike other signage material, it will not swell, crack or rot.

The material is manufactured by extruding one color on the inside and a contrasting color on the outside. The layers are combined while the material is still molten. The result is a homogenous sheet that is guaranteed not to delaminate, crack or chip. It is superior to other sign materials, which are separate layers of material laminated together.

Sign Board is easily routed or engraved using current CNC router technology. As the skin of the material is removed by the router, the inside color shows through and, voila, a sign is easily fabricated with minimum finishing requirements. The material does not have to be painted because the color is embedded into the sheet. The durable textured finish resists scratches and marring. The product is UV stabilized to resist deterioration in harsh outdoor environments, making it the perfect signage material.
